Aaron Leung

Please describe the difference between creating a website using an Application such as Adobe Dreamweaver and a Content Management System such as WordPress.

WordPress is much more of a template for website design with tools such as automatic link embedding and templates to very easily import files and text instantly into the site format, whereas a more coding and hands-on method for web design is in line with Adobe Dreamweaver and similar applications which allows much more customization and in depth tweaking.

Please explain why an image created for the web is a compressed file format such as a .png, .gif, .jpg instead of an application based file such as a .psd.

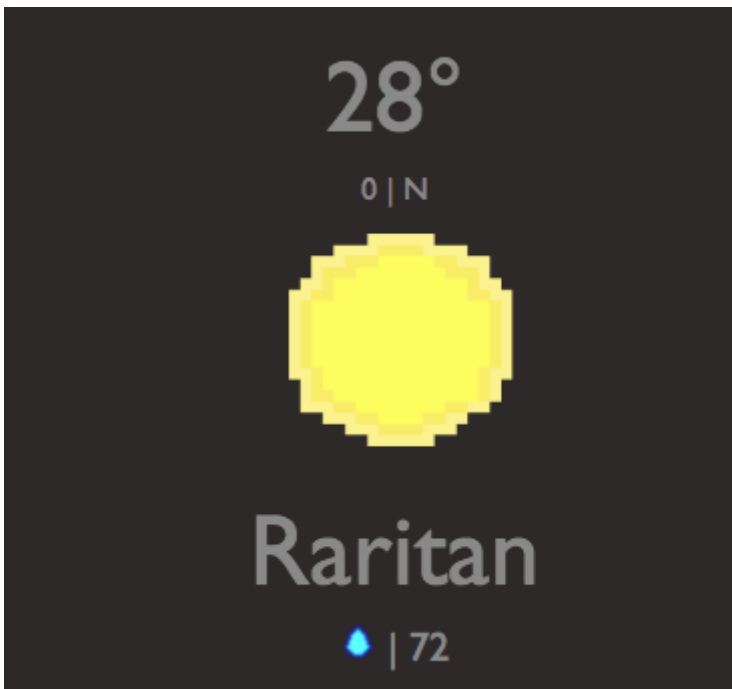

.psd files are incapable for applications other than Adobe Photoshop to be viewable without the program due to the file type containing so much data that allows for any changes or tweaking of the file such as the layers, layer styles, etc. Converting or exporting .psd files to any base format for websites such as .png, .jpeg, .webp, etc. will allow a vast majority of websites to display the file without issue.

Please explain the process Fender may have used to make give his logo this special effect.

The logo was likely made using the Bevel & Emboss tool, masking the "F" shapes inward/backwards rather than outwards/forwards.

Please explain in your own words the method we used to get our webpages to display the current weather.

Embedding a pre-existing code into the source code allowed for the weather to be linked to a site that kept all the information needed up to date onto our custom websites. Importing our own weather texture files into the code allowed for us to display it uniquely as well.

Create an Animated Gif based on New Year's 2023
