Caroline

Please describe the difference between creating a website using an Application such as Adobe Dreamweaver and a Content Management System such as WordPress.

Dreamweaver is application used to create websites verses WordPress has templates with the code all ready for use and website management.

Please explain why an image created for the web is a compressed file format such as a .png, .gif, .jpg instead of an application based file such as a .psd.

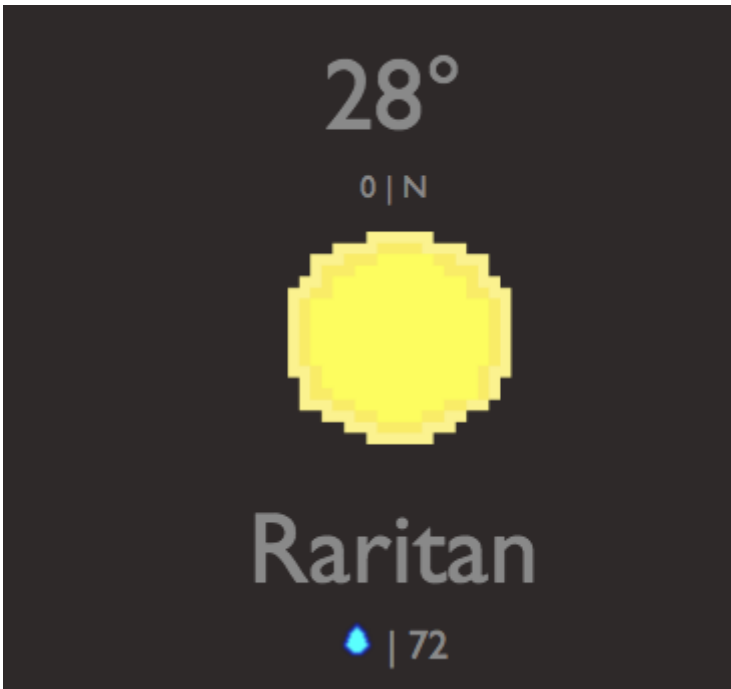

Photoshop files are much larger and take longer to load. When the file is compressed is is the small enough to run faster than its original photoshop file.

Please explain the process Fender may have used to make give his logo this special effect.

Fender most likely drew a line either in Photoshop or Illustrator. He then copied, mirrored and flipped the lines. To create the shadow effect he probably applied a drop shadow to his line work.

Please explain in your own words the method we used to get our webpages to display the current weather.

To get a website to display current weather you need to insert Java Script into the websites code. You then need to update the location and temperature.

Create an Animated Gif based on New Year's 2023
