Please describe the difference between creating a website using an Application such as Adobe Dreamweaver and a Content Management System such as WordPress.

When creating a website with dreamweaver we had to write the code for the entire website. With a website creator such as WordPress all of the basic components were there for us to choose from. With Wordpress there is no individual code writing we were only tasked with designing how the web page looked. Wordpress was much more user friendly and made web design much easier.

Please explain why an image created for the web is a compressed file format such as a .png, .gif, .jpg instead of an application based file such as a .psd.

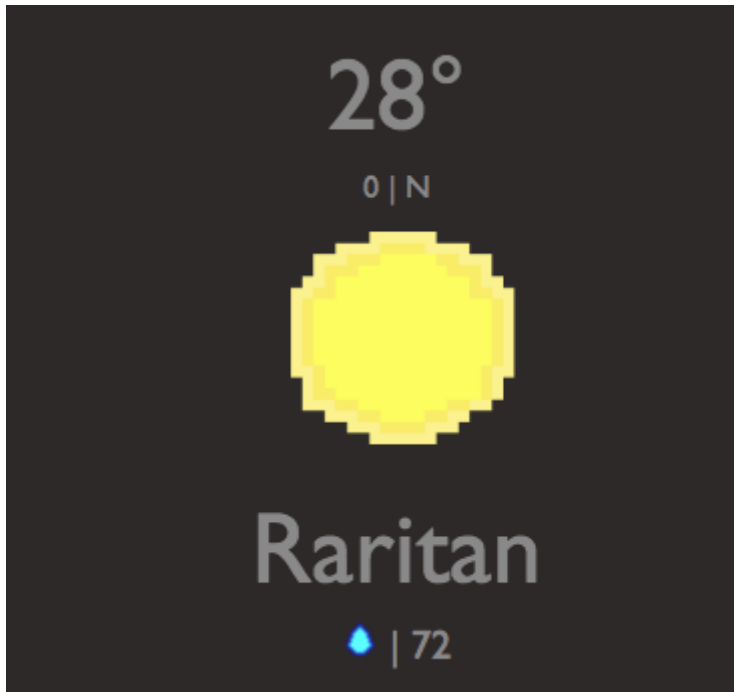

Most times when uploading a file to the web a .png, .gif, and .jpg are universally accepted. These files are smaller than a .psd file and can be read by the web much easier. Most times uploading a .psd won't even work because the file can't be read. The smaller compressed files are easier to work with overall.

Please explain the process Fender may have used to make give his logo this special effect.

This logo was probably made in photoshop or illustrator. Both are programs with plenty of tools to add drop shadows, lighting effects, etc. I think fender created the letter forms using the pen tool, then added an inner glow and drop shadow to the forms creating this look.

Please explain in your own words the method we used to get our webpages to display the current weather.

In order to have a website display the weather we first made graphics for a certain amount of weather occurrences. We then put these images into a folder and numbered them. We numbered them in order for the website to change out the weather graphic accordingly. The weather graphic was achieved using a style sheet created by another student. We used dreamweaver to paste it into our code and subsequently made a folder the website would go to for the graphics.

Create an Animated Gif based on New Year's 2023
