Please describe the difference between creating a website using an Application such as Adobe Dreamweaver and a Content Management System such as WordPress.

The principle difference between creating a website with an Application such as Adobe Dreamweaver as opposed to with a Content Management System is that the latter allows one to work live on the web. This means that changes can be viewed in real time on the internet as they are being made, without the bother of uploading a file. Another advantage of working this way is that the project can be accessed by any device capable of connecting to the internet, and so can be worked on from most any location.

Please explain why an image created for the web is a compressed file format such as a .png, .gif, .jpg instead of an application based file such as a .psd.

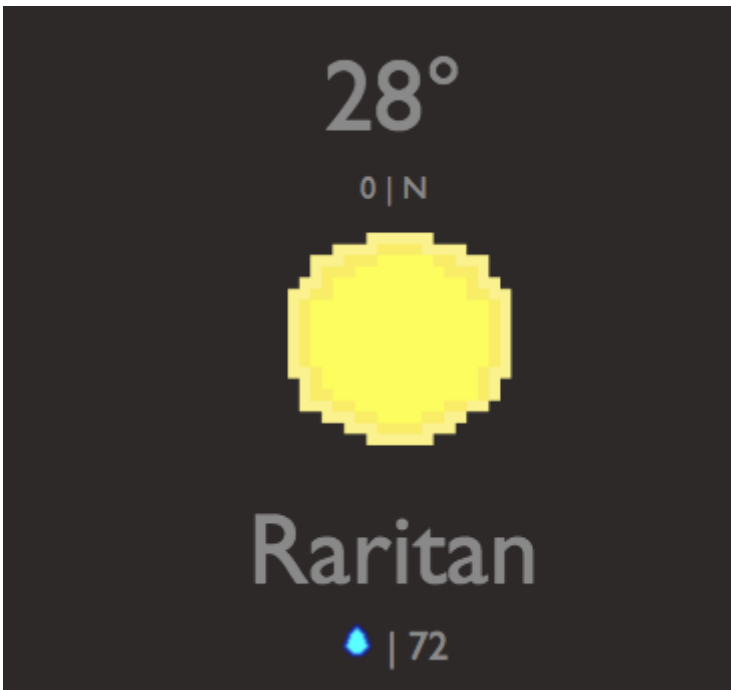

A file made for the web will be compressed so that it will load faster and not slow down the website on which it is portrayed.

Please explain the process Fender may have used to make give his logo this special effect.

Fender used the shadow effect to give his logo the appearance of being embossed.

Please explain in your own words the method we used to get our webpages to display the current weather.

In order to get our webpages to display the current weather, we first put a javascript template into our code. We then determined what symbols we needed to make, and when they were made named them appropriately so the java script would reference them as needed.

Create an Animated Gif based on New Year's 2023
