Please describe the difference between creating a website using an Application such as Adobe Dreamweaver and a Content Management System such as WordPress.

When creating a website using an application like Adobe Dreamweaver it uses an html that you have to put live like Dreamhost. In Content Management System like WordPress it already live but you have to publish it and fill in the blanks more with what you want. It is a provided templet while Dreamweaver is more freedom.

Please explain why an image created for the web is a compressed file format such as a .png, .gif, .jpg instead of an application based file such as a .psd.

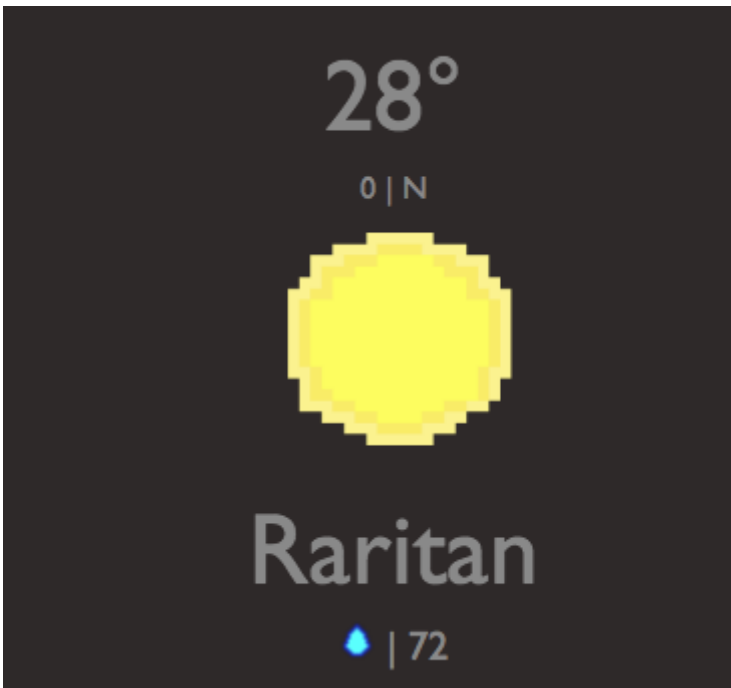

Some images are large for some computers are unable to store or process the data, so compression is the amount of data in an image is reduced without the loss of information.

Please explain the process Fender may have used to make give his logo this special effect.

In Photoshop there is a tab with 3D affects and one of them is a Bevel & Emboss.
.....

Please explain in your own words the method we used to get our webpages to display the current weather.

You create the images for the type of weather and then you upload it to Dream-host and replace the previous
flies by naming it your own. This would allow it to go through an app or website that is linked and that tells
this system what the weather is for the day.
.....

Create an Animated Gif based on New Year's 2023
