Please describe the difference between creating a website using an Application such as Adobe Dreamweaver and a Content Management System such as WordPress.

The difference between Adobe Dreamweaver and Wordpress is based off what end of the website the user is editing. In Adobe Dreamweaver, the user is working off the backend of the website by inputting code to achieve how they wish for the website to look and operate. Wordpress gives users templates to build off to create a desired aesthetic of a website. This system develops the code for the website on its own, so that the user only has to input what they would like the website to look like without the hassle of learning and inputting code.

Please explain why an image created for the web is a compressed file format such as a .png, .gif, .jpg instead of an application based file such as a .psd.

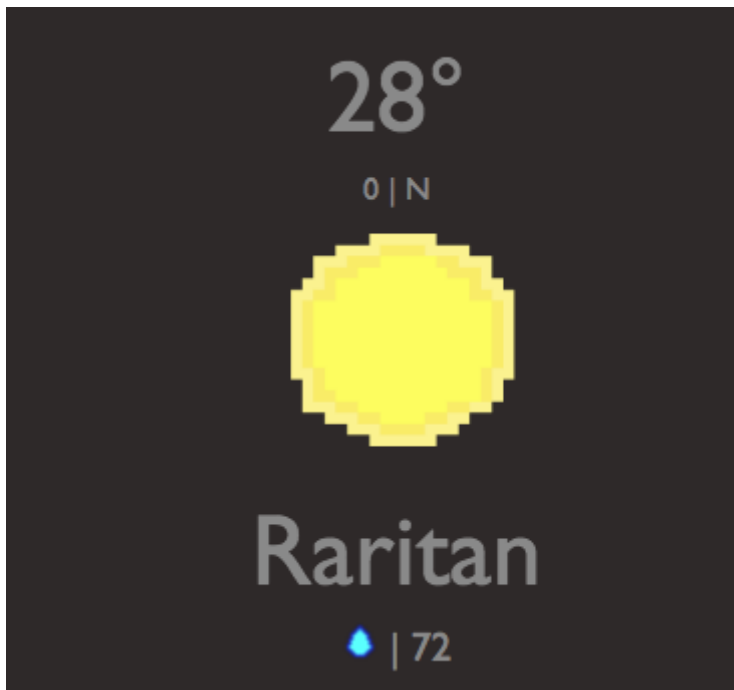

A .psd file is a working file that is meant to be used in the adobe photoshop program. A compressed file such as a .png, .gif etc, is a flattened version that is compatible to work on any program or web.

Please explain the process Fender may have used to make give his logo this special effect.

Fender may have used the bezel and emboss effect to make the logo look indented. This effect applies a fake light source to make it look 3-dimensional.

Please explain in your own words the method we used to get our webpages to display the current weather.

We used a pre made code that takes the whether based in a chosen area, and selects a given graphic based off the weather. We made different graphics for sunny, rainy cloudy, etc, and told the code that when the forecast app reads a certain weather, the corresponding graphic we input will be displayed.

Create an Animated Gif based on New Year's 2023
